We will be working on World in Electric Green - Renewable Energy Consumptions tableau dashboard to improvise interactivity and to add more relevant charts. This dashboard tries to project renewable energy consumption trend across the world among different age groups over years.

We found the dataset used in this dashboard on <https://data.worldbank.org/indicator/EG.FEC.RNEW.ZS>

The dashboard is quite interactive but there are minute mistakes here and there. There is a lot of missing information. The color combinations are not expressive. The graphs do not have proper legends and need more interactivity. The chart is also compressed with a lot of information so it would be better to display data based on search and filter.
